Working at Heights

RIIWH5204E

Work safely at heights

Course Overview

Working at heights poses a significant risk, whether it's the threat of falling from, into, or through one level to another, or the potential danger of objects falling and harming others below.

In the realm of working at heights, meticulous preparation and strategic planning are paramount. Falls from elevated surfaces can inflict permanent and life-altering injuries on employees. These incidents frequently transpire from rooftops, scaffolds, ladders, or elevated platforms like mezzanine floors, or they can involve falls into pits or holes. It's crucial to recognize that even falls from heights less than one meter can lead to severe injuries.

To work in civil, you need to train with the civil experts.
